Concept 6.1: Biologists use microscopes and the tools of biochemistry to study cells

Concept 6.2: Eukaryotic cells have internal membranes that compartmentalize their functions

Eukaryotic cells are characterized by having - DNA in a nucleus that is bounded by a

Metabolic requirements set upper limits on the size of cells cells get bigger, the amount of membrane space they have decreases per unit volume In other words, the smaller a cell is, the more membrane surface area it has (per unit volume) to take in nutrients and release wastes

Concept 6.3: The eukaryotic cell's genetic instructions are housed in the nucleus and carried out by the ribosomes

Pores regulate the entry and exit of molecules from the nucleus

Concept 6.4: The endomembrane system regulates protein traffic and performs metabolic functions in the cell

The Endoplasmic Reticulum (ER): Biosynthetic Factory

The Golgi Apparatus: Shipping and Receiving Center «consists of flattened membranous sacs called cisternae • Functions - Correctly folds and modifies proteins made in the ER

Lysosomes: Recyclers «Some types of cell can engulf another cell by phagocytosis

Concept 6.5: Mitochondria and chloroplasts change energy from one form to another

The Evolutionary Origins of Mitochondria and Chloroplasts

Where did mitochondria and chloroplasts come from? • The Endosymbiont theory - An early ancestor of eukaryotic cells engulfed a non- photosynthetic prokaryotic cell, which formed an

Concept 6.6: The cytoskeleton is a network of fibers that organizes structures and activities in the cell

Microfilaments that function in cellular motility contain the protein myosin in addition to actin

Localized contraction brought about by actin and myosin also drives amoeboid movement •

Pseudopodia (cellular extensions) extend and contract through the reversible assembly and contraction of actin subunits into microfilaments

Concept 6.7: Extracellular components and connections between cells help coordinate cellular activities

Written by two of the most respected, experienced and well-known researchers and developers in the field (e.g., Kiencke worked at Bosch where he helped develop anti-breaking system and engine control; Nielsen has lead joint research projects with Scania AB, Mecel AB, Saab Automobile AB, Volvo AB, Fiat GM Powertrain AB, and DaimlerChrysler. Reflecting the trend to optimization through integrative approaches for engine, driveline and vehicle control, this valuable book enables control engineers to understand engine and vehicle models necessary for controller design and also introduces mechanical engineers to vehicle-specific signal processing and automatic control. Emphasis on measurement, comparisons between performance and modelling, and realistic examples derive from the authors' unique industrial experience . The second edition offers new or expanded topics such as diesel-engine modelling, diagnosis and anti-jerking control, and vehicle modelling and parameter estimation. With only a few exceptions, the approaches
