What is the definition of the stationary phase?

After injection the analytes enters the mobile phase

Subsequently the mobile phase transports the analytes to the stationary phase

Stationary phase: The phase where the analytes moves through the column

A column is a tube filled with solid adsorbent material

Packing material consists of pellicular or porous particles

The analytes will be separated based on their different degrees of interaction with the particles.

The yellow analyte is polar/hydrophilic and has no affinity with the stationary phase

The red analyte is polar/hydrophobic and adsorbs the non polar stationary phase

The more hydrophobic the molecule is, the stronger it will bind with the stationary phase

The stationary phase works like a magnet for the red analyte. It binds, but mobile phase pushes the analyte slowly through the column
