Intro

According to the IEEE Communications category magazine's definition, IoT is a framework of all things that have a representation in the presence of the internet in such a way that new applications and services enable the interaction in the physical and virtual world in the form of Machine-to-Machine (M2M) communication in the cloud.

The Internet of Things (IoT) is the network of physical objects or "things" embedded with electronics, software, sensors, and network connectivity, which enables these objects to collect and exchange data.

The most important features of IoT include Artificial Intelligence, Connectivity, Sensors, Active engagement, and Small device use. IOT - CONNECTS DEVICES

Active Engagement - Much of today's interaction with connected technology happens through passive engagement. IoT introduces a new paradigm for active content, product, or service engagement.

The Internet, itself a significant component of the IoT, started out as part of DARPA (Defense Advanced Research Projects Agency) in 1962 and evolved into ARPANET in 1969.

Improved Customer Engagement - Current analytics suffer from blind spots and significant flaws in accuracy; and as noted, engagement remains passive. IoT completely transforms this to achieve richer and more effective engagement with audiences.

Reduced Waste - IoT makes areas of improvement clear. Current analytics give us superficial insight, but IoT provides real-world information leading to the more effective management of resources.

As the number of connected devices increases and more information is shared between devices, the potential that a hacker could steal confidential information also increases.

Since there's no international standard of compatibility for IoT, it's difficult for devices from different manufacturers to communicate with each other

Security - IoT creates an ecosystem of constantly connected devices communicating over networks. The system offers little control despite any security measures. This leaves users exposed to various kinds of attackers.

Flexibility - Many are concerned about the flexibility of an IoT system to integrate easily with another. They worry about finding themselves with several conflicting or locking systems.

An IoT ecosystem consists of web-enabled smart devices that use embedded processors, sensors and communication hardware to collect, send and act on data they acquire from their environments. IoT device can be explained as a network of things that consists of hardware, software, network connectivity, and sensors.

Sensing Layer - The main purpose of the sensing layer is to identify any phenomena in the devices' peripheral and obtain data from the real

Motion Sensors: Motion sensors measure the change in motion as well as the orientation of the devices. There are two types of motions one can observe in a device: linear and angular motions.

Environmental Sensors: sense the change in environmental parameters in the device's peripheral. E.g. Light sensors, Pressure sensors, etc.

Position sensors: Position sensors of IoT devices deal with the physical position and location of the device. Eg, magnetic sensors and Global Positioning System (GPS) sensors.

Network Layer - The network layer acts as a communication channel to transfer data, collected in the sensing layer, to other connected devices.

Application Layer - The application layer implements and presents the results of the data processing layer.

Agriculture - For indoor planting, IoT makes monitoring and management of microclimate conditions a reality, which in turn increases production
