Systems Science and Cybernetics - Volume II

The subject "Systems sciences and cybernetics" is the outcome of the convergence of a number of trends in a larger current of thought devoted to the growing complexity of (primarily social) objects and arising in response to the need for globalized treatment of such objects. This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects, advances in the theories on their inter-relations, the enormous computational capacity provided by IT hardware and software and the critical revisiting of subject-object interaction, not to mention the urgent need to control the efficiency of complex systems, where "efficiency" is understood to mean the ability to find a solution to many social problems, including those posed on a planetary scale. The result has been the forging of a new, academically consolidated scientific trend going by the name of Systems Theory and Cybernetics, with a comprehensive, multi-disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic. This subject entry is subdivided into four sections. The first, an introduction to systemic theories, addresses the historic development of the most commonly used systemic approaches, from new concepts such as the so-called "geometry of thinking" or the systemic treatment of "non-systemic identities" to the taxonomic, entropic, axiological and ethical problems deriving from a general "systemic-cybernetic" conceit. Hence, the focus in this section is on the historic and philosophical aspects of the subject. Moreover, it may be asserted today that, beyond a shadow of a doubt, problems, in particular problems deriving from human interaction but in general any problem regardless of its nature, must be posed from a systemic perspective, for otherwise the obstacles to their solution are insurmountable. Reaching such a perspective requires taking at least the following well-known steps: a) statement of the problem from the determinant variables or phenomena; b) adoption of theoretical models showing the interrelationships among such variables; c) use of the maximum amount of – wherever possible quantitative – information available on each; d) placement of the set of variables in an environment that inevitably pre-determines the problem. That epistemology would explain the substantial development of the systemic-cybernetic approach in recent decades. The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems, from issues that affect humanity as a whole to minor but specific questions arising in human organizations. Certain sub-themes are discussed by the various authors – always from a didactic vantage –, including: problem discovery and diagnosis and development of the respective critical theory; the design of ad hoc strategies and methodologies; the implementation of both qualitative (soft system methodologies) and formal and quantitative (such as the "General System Problem Solver" or the "axiological-operational" perspective) approaches; cross-disciplinary integration; and suitable methods for broaching psychological, cultural and socio-political dynamisms. The third section is devoted to cybernetics in the present dual meaning of the term: on the one hand, control of the effectiveness of communication and actions, and on the other, the processes of self-production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed. Known as "second

order cybernetics”, this provides an avenue for rethinking the validity of knowledge, such as for instance when viewed through what is known as “bipolar feedback”: processes through which interactions create novelty, complexity and diversity. Finally, the fourth section centres around artificial and computational intelligence, addressing sub-themes such as “neural networks”, the “simulated annealing” that ranges from statistical thermodynamics to combinatorial problem-solving, such as in the explanation of the role of adaptive systems, or when discussing the relationship between biological and computational intelligence.

Value-added Partnering and Innovation in a Changing World

This volume addresses the challenges faced by value-added networking and innovation, both for firms' strategies and public policies in a context increasingly influenced by dynamics of interacting networks that underlie knowledge, creation, diffusion, and utilization. Part two addresses the need for value-added learning by local and regional governments concerning the building of an innovation system and the adoption of new ICT applications in cities. Part three focuses on firms, their management and strategies, and their performance in terms of innovativeness and growth.

Technology in the world today has contributed to promote organisational competitiveness and national development. But most developing countries have not substantially benefited from science and technology, hence their underdevelopment and poverty. They could not harness and manage their scientific and technological innovations and use their human and material resources to meet basic needs of their people, reduce socio-economic inequalities, create employment opportunities and improve national security. The achievement of these is considered in this book to be dependent on provisions of conducive environments for effective human resource management for scientific and technological innovations. Human resource management concepts and practices were used to evolve frameworks and processes for the generation, acquisition, adoption, and transfer of technology, depending on the objectives of different countries and organisations.

Problem Solving for Results

Real time strategic change is a way of redesigning how organizations change-a mindset and accompanying methodology-that ensures that

- Change occurs at a fast pace and in real time throughout an organization.
- Change occurs simultaneously within the whole organization.
- Buy-in, commitment to, and ownership of a change effort is a natural by-product of involving people in the process of change.
- People feel responsible for the ultimate success of the organization's change effort.
- Broad, whole-picture views of the organization's reality form the basis of information used to support people in making changes.
- Change is viewed as an integral component of people's "real business."
- Substantial changes are made across an entire organization.

The most successful organizations of the future will be those that are capable of rapidly and effectively bringing about fundamental, lasting, system-wide changes. In response to this challenge, Real Time Strategic Change advocates a fundamental redesign of the way organizations change. The result is an approach that involves an entire organization in fast and far-reaching change. Interactive large group meetings form the foundation for this approach, enabling hundreds and even thousands of people to collaborate in crafting their collective future. Change happens faster because the total organization is the "in group" that decides which changes are needed; and the actions people throughout the organization take on a daily basis are aligned behind an overall strategic direction that they helped create. Complete with conceptual frameworks, tools and techniques, agendas, and roles key actors need to play, this is the first book published on this powerful approach to organizational change. The process Robert Jacobs details has proven effective in diverse settings, ranging from business and industry to health care, education, government, non-profit agencies, and communities. Real Time Strategic Change demonstrates the flexibility and power of this approach in stories from such diverse organizations as Marriott Hotels, Ford Motor Company, Kaiser Permanente, First Nationwide Bank, United Airlines, and a group of 18 school districts.

Many organisations are using an increased range of information technologies to support a variety of new organisational practices and organisational forms. The book aims to investigate the integration of information technologies into work places and their effect on work and work-life. Issues include changes in: the nature, quantity and quality of work; power relations; privacy; and aspects of organisational culture. The book also considers the social process of shifting from present organisational structures and practices to new ones.

Using current business examples and academic research, Tools for Systematic Problem-Solving educates managers and executives on how to systematically examine key assumptions to ensure survival and success for their organizations.

Made-to-Measure Problem-Solving

The best time to stop projects or programs that will not be successful is before they are ever started. Research has shown that the focused use of realistic business case analysis on proposed initiatives could enable your organization to reduce the amount of project waste and churn (rework) by up to 40 percent, potentially avoiding millions of dollars lost on projects, programs, and initiatives that would fail to produce the desired results. This book illustrates how to develop a strong business case which links investments to program results and, ultimately, with the strategic outcomes of the organization. In addition, the book provides a template and example case studies for those seeking to fast-track the development of a business case within their organization. Making the Case for Change: Using Effective Business Cases to Minimize Project and Innovation Failures provides executive teams and change agents with the information required to make better business case decisions. This book can be used throughout the life cycle of the project to assist with gaining a better understanding of the following key knowledge areas for developing a business case: Understanding the present problem/improvement opportunity Documenting how the project, program, or initiative will add value to the organization Validating the data and the assumptions that the projected improvements are based upon Calculating the level of confidence that can be placed upon the conclusions that are reached Assessing the alternative solutions that were considered Weighing the costs vs. the benefits of the proposed initiative Analyzing and mitigating the risks to completing 100 percent of the project's goals Eliciting and prioritizing the requirements of key stakeholders and subject matter experts Identifying the key people that are involved in the proposed project and the skills needed to implement the proposed change Obtaining consensus on the decision to move forward, as well as on the methods used and the conclusions specified in the analysis Ideal for executives and project/initiative managers seeking approval of an activity, initiative, program, or project, the book presents proven tips, advice, suggestions, and recommended courses of action for developing effective business cases. In addition, suggestions for recruiting a responsible senior officer or sponsor for the project and for engaging an audience are provided. The authors combine their own experience in business case development with approaches used by world-class organizations. They provide a general range of assessment criteria that can be applied to almost any type of project business cases. The text discusses each of the 8 activities and the 35 tasks that make up the business case development process. This process supplies you with a proven approach for creating comprehensive and well-constructed business case evaluations that will either ensure the success of your project, or eliminate unsuccessful projects, programs, and initiatives before they start.

Managing Information Technology Resources and Applications in the World Economy

Johnny Sung and David Ashton are two of the leading scholars in the area of skills. This book combines challenging theories with cutting edge research in a way that should bring skills to life for students. I strongly recommend it for anyone researching or studying in this area. - Irena Grugulis, Leeds University Business School "A much needed contribution to the complex debate of how skills can best be utilised to enhance company performance, with particular emphasis on an innovative sectoral approach. It is a model of clarity in its presentation of the authors' conceptual models using a historical narrative as well as comparative case studies in both the UK and Singapore." - Bert Clough, Leeds University Business School Public skills policy in most market economies in the last forty years made one repeated error, time and again. We seem to be unable to learn from those mistakes. Consistently, public policies view a wide range of economic and social issues e.g. low productivity, low-skilled jobs, low wage, inequality and in-work poverty as the consequence of skills deficits and a lack of qualifications held by individual workers. Whilst mis-diagnosing the source of the problems and failing to deliver any effective change, public skills policies continue with a policy prescription of 'more skills' and 'more degrees'. If we have not solved the problems with this decade-old approach, why should the same medicine work this time? This book examines the role of public skills policy from a completely different perspective. It starts by challenging the lack of a systematic analysis of the link between skills utilisation and business strategy, and provides a new model for fresh thinking. The book extends this theoretical analysis to examine the implications for the sectoral approach to skills development as a more effective form of public skills policy. David N. Ashton is Emeritus Professor at the University of Leicester and Honorary Professor at Cardiff University. Johnny Sung is at The Institute for Adult Learning, Singapore Workforce Development Agency, Singapore.

EJISE Volume 15 Issue 1

When you work in the area of Operational Excellence, Business Excellence, Continuous Improvement, Lean or any of the other labels we give to making businesses better you are continually asked about problem solving. Even amongst fellow professionals there is a huge variation in the capability to solve problems. Throughout my career I have been trained in so many different problem solving methods from Six Sigma and Kepner-Tregoe to A3 Thinking and the 7 Quality Tools that it becomes a bit confusing to explain to others how it all fits together. So I wrote this guide originally to help my fellow Business Excellence professional make sense of the plethora of methodologies, tools and training courses on offer throughout a large multi-national organization. And now I'd like to share the guide with you: Problem Solvers of the World. My greatest learning over the last fifteen years has been that the methodologies and tools are just a means of teaching critical thinking. It is not necessary to always slavishly follow the methods when you have mastered them but it is necessary to think about each problem in its own right and apply the principles of problem solving at any point in your journey. The world needs better problem solvers and problem solving is not easy. Each problem will have its own unique set of circumstances and conditions and each will require a unique approach. If you can be both methodical and flexible at the same time then you are on the way to becoming an expert problem solver. I hope that in some small way this book helps you to steer your way through the often complex world of problem solving in business.

This handbook is the most comprehensive and interdisciplinary work on marine conservation and fisheries management ever compiled. It is the first to bridge fisheries and marine conservation issues. Its innovative ideas, detailed case studies, and governance framework provide a global special perspective over time and treat problems in the high seas, community fisheries, industrial fishing, and the many interactions between use and non-use of the oceans. Its policy tools and ideas for overcoming the perennial problems of over fishing, habitat and biodiversity loss address the facts that many marine ecosystems are in decline and plagued by overexploitation due to unsustainable fishing practices. An outstanding feature of the book is the detailed case-studies on conservation practice and fisheries management from around the world. These case studies are combined with 'foundation' chapters that provide an overview of the state of the marine world and innovative and far reaching perspectives about how we can move forward to face present and future challenges. The contributors include the world's leading fisheries scientists, economists, and managers. Ecosystem and incentive-based approaches are described and complemented by tools for cooperative, participatory solutions. Unique themes treated: fisher behavior and incentives for management beyond rights-based approaches; a synthesis of proposed 'solutions'; a framework for understanding and overcoming the critical determinants of the decline in fisheries, degradation of marine ecosystems, and poor socio-economic performance of many fishing communities; models for innovative policy instruments; a plan of action and adoption pathways to promote sustainable fishing practices globally. Collectively, the handbook's many valuable contributions offer a way forward to both understanding and resolving the multifaceted problems facing the world's oceans.

Systems Science and Cybernetics - Volume II

The subject "Systems sciences and cybernetics" is the outcome of the convergence of a number of trends in a larger current of thought devoted to the growing complexity of (primarily social) objects and arising in response to the need for globalized treatment of such objects. This has been magnified by the proliferation and publication of all manner of quantitative scientific data on such objects, advances in the theories on their inter-relations, the enormous computational capacity provided by IT hardware and software and the critical revisiting of subject-object interaction, not to mention the urgent need to control the efficiency of complex systems, where "efficiency" is understood to mean the ability to find a solution to many social problems, including those posed on a planetary scale. The result has been the forging of a new, academically consolidated scientific trend going by the name of Systems Theory and Cybernetics, with a comprehensive, multi-disciplinary focus and therefore apt for understanding realities still regarded to be inescapably chaotic. This subject entry is subdivided into four sections. The first, an introduction to systemic theories, addresses the historic development of the most commonly used systemic approaches, from new concepts such as the so-called "geometry of thinking" or the systemic treatment of "non-systemic identities" to the taxonomic, entropic, axiological and ethical problems deriving from a general "systemic-cybernetic" conceit. Hence, the focus in this section is on the historic and philosophical aspects of the subject. Moreover, it may be asserted today that, beyond a shadow of a doubt, problems, in particular problems deriving from human interaction but in general any problem regardless of its nature, must be posed from a systemic perspective, for otherwise the obstacles to their solution are insurmountable. Reaching such a perspective requires taking at least the following well-known steps: a) statement of the problem from the determinant variables or phenomena; b) adoption of theoretical models showing the interrelationships among such variables; c) use of the maximum amount of – wherever possible quantitative – information available on each; d) placement of the set of variables in an environment that inevitably pre-determines the problem. That epistemology would explain the substantial development of the systemic-cybernetic approach in recent decades. The articles in the second section deal in particular with the different methodological approaches developed when confronting real problems, from issues that affect humanity as a whole to minor but specific questions arising in human organizations. Certain sub-themes are discussed by the various authors – always from a didactic vantage –, including: problem discovery and diagnosis and development of the respective critical theory; the design of ad hoc strategies and methodologies; the implementation of both qualitative (soft system methodologies) and formal and quantitative (such as the "General

System Problem Solver” or the “axiological-operational” perspective) approaches; cross-disciplinary integration; and suitable methods for broaching psychological, cultural and socio-political dynamisms. The third section is devoted to cybernetics in the present dual meaning of the term: on the one hand, control of the effectiveness of communication and actions, and on the other, the processes of self-production of knowledge through reflection and the relationship between the observing subject and the observed object when the latter is also observer and the former observed. Known as “second order cybernetics”, this provides an avenue for rethinking the validity of knowledge, such as for instance when viewed through what is known as “bipolar feedback”: processes through which interactions create novelty, complexity and diversity. Finally, the fourth section centres around artificial and computational intelligence, addressing sub-themes such as “neural networks”, the “simulated annealing” that ranges from statistical thermodynamics to combinatory problem-solving, such as in the explanation of the role of adaptive systems, or when discussing the relationship between biological and computational intelligence.

Value-added Partnering and Innovation in a Changing World

This volume addresses the challenges faced by value-added networking and innovation, both for firms' strategies and public policies in a context increasingly influenced by dynamics of interacting networks that underlie knowledge, creation, diffusion, and utilization. Part two addresses the need for value-added learning by local and regional governments concerning the building of an innovation system and the adoption of new ICT applications in cities. Part three focuses on firms, their management and strategies, and their performance in terms of innovativeness and growth.

Which Degree Guide

Technology in the world today has contributed to promote organisational competitiveness and national development. But most developing countries have not substantially benefited from science and technology, hence their underdevelopment and poverty. They could not harness and manage their scientific and technological innovations and use their human and material resources to meet basic needs of their people, reduce socio-economic inequalities, create employment opportunities and improve national security. The achievement of these is considered in this book to be dependent on provisions of conducive environments for effective human resource management for scientific and technological innovations. Human resource management concepts and practices were used to evolve frameworks and processes for the generation, acquisition, adoption, and transfer of technology, depending on the objectives of different countries and organisations.

Problem Solving for Results

Real time strategic change is a way of redesigning how organizations change-a mindset and accompanying methodology-that ensures that

- Change occurs at a fast pace and in real time throughout an organization.
- Change occurs simultaneously within the whole organization.
- Buy-in, commitment to, and ownership of a change effort is a natural by-product of involving people in the process of change.
- People feel responsible for the ultimate success of the organization's change effort.
- Broad, whole-picture views of the organization's reality form the basis of information used to support people in making changes.
- Change is viewed as an integral component of people's "real business."
- Substantial changes are made across an entire organization.

The most successful organizations of the future will be those that are capable of rapidly and effectively bringing about fundamental, lasting, system-wide changes. In response to this challenge, Real Time Strategic Change advocates a fundamental redesign of the way organizations change. The result is an approach that involves an entire organization in fast and far-reaching change. Interactive large group meetings form the foundation for this approach, enabling hundreds and even thousands of people to collaborate in crafting their collective future. Change happens faster because the total organization is the "in group" that decides which changes are needed; and the actions people throughout the organization take on a daily basis are aligned behind an overall strategic direction that they helped create. Complete with conceptual frameworks, tools and techniques, agendas, and roles key actors need to play, this is the first book published on this powerful approach to organizational change. The process Robert Jacobs details has proven effective in diverse settings, ranging from business and industry to health care, education, government, non-profit agencies, and communities. Real Time Strategic Change demonstrates the flexibility and power of this approach in stories from such diverse organizations as Marriott Hotels, Ford Motor Company, Kaiser Permanente, First Nationwide Bank, United Airlines, and a group of 18 school districts.

Resources in Education

Many organisations are using an increased range of information technologies to support a variety of new organisational practices and organisational forms. The book aims to investigate the integration of information technologies into work places and their effect on work and work-life. Issues include changes in: the nature, quantity and quality of work; power relations; privacy; and aspects of organisational culture. The book also considers the social process of shifting from present organisational structures and practices to new ones.

Advances in Digital Science

Using current business examples and academic research, Tools for Systematic Problem-Solving educates managers and executives on how to systematically examine key assumptions to ensure survival and success for their organizations.

Made-to-Measure Problem-Solving

The best time to stop projects or programs that will not be successful is before they are ever started. Research has shown that the focused use of realistic business case analysis on proposed initiatives could enable your organization to reduce the amount of project waste and churn (rework) by up to 40 percent, potentially avoiding millions of dollars lost on projects, programs, and initiatives that would fail to produce the desired results. This book illustrates how to develop a strong business case which links investments to program results and, ultimately, with the strategic outcomes of the organization. In addition, the book provides a template and example case studies for those seeking to fast-track the development of a business case within their organization. Making the Case for Change: Using Effective Business Cases to Minimize Project and Innovation Failures provides executive teams and change agents with the information required to make better business case decisions. This book can be used throughout the life cycle of the project to assist with gaining a better understanding of the following key knowledge areas for developing a business case: Understanding the present problem/improvement opportunity Documenting how the project, program, or initiative will add value to the organization Validating the data and the assumptions that the projected improvements are based upon Calculating the level of confidence that can be placed upon the conclusions that are reached Assessing the alternative solutions that were considered Weighing the costs vs. the benefits of the proposed initiative Analyzing and mitigating the risks to completing 100 percent of the project's goals Eliciting and prioritizing the requirements of key stakeholders and subject matter experts Identifying the key people that are involved in the proposed project and the skills needed to implement the proposed change Obtaining consensus on the decision to move forward, as well as on the methods used and the conclusions specified in the analysis Ideal for executives and project/initiative managers seeking approval of an activity, initiative, program, or project, the book presents proven tips, advice, suggestions, and recommended courses of action for developing effective business cases. In addition, suggestions for recruiting a responsible senior officer or sponsor for the project and for engaging an audience are provided. The authors combine their own experience in business case development with approaches used by world-class organizations. They provide a general range of assessment criteria that can be applied to almost any type of project business cases. The text discusses each of the 8 activities and the 35 tasks that make up the business case development process. This process supplies you with a proven approach for creating comprehensive and well-constructed business case evaluations that will either ensure the success of your project, or eliminate unsuccessful projects, programs, and initiatives before they start.

Managing Information Technology Resources and Applications in the World Economy

Johnny Sung and David Ashton are two of the leading scholars in the area of skills. This book combines challenging theories with cutting edge research in a way that should bring skills to life for students. I strongly recommend it for anyone researching or studying in this area. - Irena Grugulis, Leeds University Business School "A much needed contribution to the complex debate of how skills can best be utilised to enhance company performance, with particular emphasis on an innovative sectoral approach. It is a model of clarity in its presentation of the authors' conceptual models using a historical narrative as well as comparative case studies in both the UK and Singapore." - Bert Clough, Leeds University Business School Public skills policy in most market economies in the last forty years made one repeated error, time and again. We seem to be unable to learn from those mistakes. Consistently, public policies view a wide range of economic and social issues e.g. low productivity, low-skilled jobs, low wage, inequality and in-work poverty as the consequence of skills deficits and a lack of qualifications held by individual workers. Whilst mis-diagnosing the source of the problems and failing to deliver any effective change, public skills policies continue with a policy prescription of 'more skills' and 'more degrees'. If we have not solved the problems with this decade-old approach, why should the same medicine work this time? This book examines the role of public skills policy from a completely different perspective. It starts by challenging the lack of a systematic analysis of the link between skills utilisation and business strategy, and provides a new model for fresh thinking. The book extends this theoretical analysis to examine the implications for the sectoral approach to skills development as a more effective form of public skills policy. David N. Ashton is Emeritus Professor at the University of Leicester and Honorary

Professor at Cardiff University. Johnny Sung is at The Institute for Adult Learning, Singapore Workforce Development Agency, Singapore.

EJISE Volume 15 Issue 1

When you work in the area of Operational Excellence, Business Excellence, Continuous Improvement, Lean or any of the other labels we give to making businesses better you are continually asked about problem solving. Even amongst fellow professionals there is a huge variation in the capability to solve problems. Throughout my career I have been trained in so many different problem solving methods from Six Sigma and Kepner-Tregoe to A3 Thinking and the 7 Quality Tools that it becomes a bit confusing to explain to others how it all fits together. So I wrote this guide originally to help my fellow Business Excellence professional make sense of the plethora of methodologies, tools and training courses on offer throughout a large multi-national organization. And now I'd like to share the guide with you: Problem Solvers of the World. My greatest learning over the last fifteen years has been that the methodologies and tools are just a means of teaching critical thinking. It is not necessary to always slavishly follow the methods when you have mastered them but it is necessary to think about each problem in its own right and apply the principles of problem solving at any point in your journey. The world needs better problem solvers and problem solving is not easy. Each problem will have its own unique set of circumstances and conditions and each will require a unique approach. If you can be both methodical and flexible at the same time then you are on the way to becoming an expert problem solver. I hope that in some small way this book helps you to steer your way through the often complex world of problem solving in business.

Managing Technology Innovation

This handbook is the most comprehensive and interdisciplinary work on marine conservation and fisheries management ever compiled. It is the first to bridge fisheries and marine conservation issues. Its innovative ideas, detailed case studies, and governance framework provide a global special perspective over time and treat problems in the high seas, community fisheries, industrial fishing, and the many interactions between use and non-use of the oceans. Its policy tools and ideas for overcoming the perennial problems of over fishing, habitat and biodiversity loss address the facts that many marine ecosystems are in decline and plagued by overexploitation due to unsustainable fishing practices. An outstanding feature of the book is the detailed case-studies on conservation practice and fisheries management from around the world. These case studies are combined with 'foundation' chapters that provide an overview of the state of the marine world and innovative and far reaching perspectives about how we can move forward to face present and future challenges. The contributors include the world's leading fisheries scientists, economists, and managers. Ecosystem and incentive-based approaches are described and complemented by tools for cooperative, participatory solutions. Unique themes treated: fisher behavior and incentives for management beyond rights-based approaches; a synthesis of proposed 'solutions'; a framework for understanding and overcoming the critical determinants of the decline in fisheries, degradation of marine ecosystems, and poor socio-economic performance

of many fishing communities; models for innovative policy instruments; a plan of action and adoption pathways to promote sustainable fishing practices globally. Collectively, the handbook's many valuable contributions offer a way forward to both understanding and resolving the multifaceted problems facing the world's oceans.

Real Time Strategic Change

Innovative solutions for difficult challenges – Two detailed case studies sharing the experiences in solving challenging problems in innovative ways Systematic Innovation on the fly – How to utilize individual innovation tools for quick innovative effect Multiple other new case studies throughout The addition of Lean in the chapter on integrated methodologies More links between chapters increasing the understanding of application More application examples demonstrating application techniques of professionals Clarifies how the patterns of evolution are used to generate both "what-if" scenarios, and real-world forecasts with remarkable accuracy. Illustrates how small and large companies, government agencies, and other groups of people are using TRIZ and achieving significant results and gives you step-by-step instructions on bringing TRIZ into your organization.
